

Build Your Website with AI

From your résumé to a live portfolio site — using Lovable or Bolt.new.

 **Time** — about 20 minutes, fully hands-on

 **You'll need** — a laptop and your résumé (or a LinkedIn profile to export)

 **You'll leave with** — a real portfolio website, deployed at a public link

1 • What Are Lovable & Bolt.new?

Lovable and Bolt.new are **AI website and app builders**. You describe what you want in plain language — or attach a document like your résumé — and they generate a complete, working website for you: the design, the pages, and the code behind it. You preview it instantly, refine it by chatting, and deploy it to a live link.

You never open a code editor and you never set up hosting. The website is real and running from the first prompt; you simply keep talking to it until it is exactly what you want.

How does it work?

You attach your résumé and write a prompt → the tool builds a full website and shows you a live preview → you ask for changes in plain English (“make the header darker”, “add a projects section”) → it rebuilds in seconds → when you are happy, you click **Publish** and get a shareable URL. The whole loop happens in one place.

Lovable or Bolt.new — which one?

Either works for everything in this lab; the steps are the same for both. The difference is mostly in feel.

Tool	Best thought of as...
Lovable	A guided, design-forward builder — great when you want a polished site quickly with a friendly chat workflow.
Bolt.new	A fast in-browser build environment — great when you want to see and tweak things rapidly and stay close to the build.

Both have a free tier to start, both let you attach files, both let you iterate by chatting, and both deploy with one click. Pick whichever you have open — you can always try the other later.

2 • Why a Portfolio Site First?

A personal portfolio is the perfect first build. You already own the content — it is sitting in your résumé — so you can focus on learning the loop instead of inventing material. It is personal, so you will actually care how it looks. And the result is genuinely useful: one link you can put on your LinkedIn, your email signature, and every application you send.

If you are a...	Your portfolio can showcase...
Job seeker	A clean summary of experience, skills, and a clear way to contact you
Freelancer	Past projects, services offered, testimonials, and a hire-me call to action
Student / Grad	Projects, coursework, internships, and what you are looking for next
Career switcher	Transferable skills and a story that reframes your background
Creator / Speaker	Talks, writing, and links to your work in one tidy place

The real skill you are learning

This is not really about a portfolio. It is the full AI-building loop — *input* → *generate* → *iterate* → *deploy*. Once you have done it once, you can build a landing page, an internal tool, or a side project the exact same way.

3 • Build Your Portfolio Site

🕒 **The hands-on lab.** Follow these six steps in order. By the end you will have a real portfolio website, live at a link you can share.

1. Get your résumé ready

You need one document the tool can read. Use whichever is faster:

- **Option A — your existing résumé.** A recent PDF or Word file works perfectly. Make sure it includes your name, headline/title, experience, skills, and contact details.
- **Option B — export from LinkedIn.** Open your LinkedIn profile, click the **Resources** button near your name (it may sit under **More**), choose **Save to PDF**, and download the file.

Two minutes well spent

Quickly skim the file before you upload it. Remove anything outdated, make sure your best work is on it, and check that your email and links (LinkedIn, GitHub, portfolio) are present. A cleaner input gives a sharper website.

2. Sign up to Lovable or Bolt.new

Go to **lovable.dev** or **bolt.new** and create a free account (signing in with Google or GitHub is the quickest route). Once you are in, start a **new project**.

3. Attach your résumé

In the prompt box, use the **attach / upload** control (usually a paperclip or “+” icon) and add your résumé file. The tool will read it and use its contents as the source material for your site.

4. Give your prompt

A one-line prompt like “build a portfolio from my résumé” will work — but a detailed prompt produces a site you barely need to fix. Tell it the sections, the style, and the behaviour you want.

✗ “Based on my resume, build a personal portfolio website for me.”

✓ **Specific prompt:** “Using the attached résumé, build me a modern, single-page personal portfolio website. Include: a **hero** with my name, professional headline, and a one-line tagline; an **About** section summarising my background in 2–3 sentences; an **Experience** timeline (role, company, dates, and 1–2 highlight bullets each); a **Skills** section grouped by category; a **Projects / Highlights** section; and a **Contact** section with my email and links to LinkedIn and GitHub. Use a clean, professional design with a calm colour palette, clear typography, and generous spacing. Add a sticky navigation bar, smooth scrolling between sections, and subtle entrance animations. Make it fully responsive on mobile. Where my résumé is missing something, use clearly-marked placeholder text so I can fill it in later.”

Submit it and wait a few moments — the tool will build the whole site and show you a live preview.

5. Iterate on it

The first version is a starting point, not the finish line. Refine it by chatting — **one clear change at a time** gets the best results:

- “Change the colour scheme to navy and warm grey.”
- “Make the hero full-screen and centre my name.”
- “Add a Projects section with three cards I can edit.”
- “Add a contact form that emails me, and a download-résumé button.”
- “Improve mobile spacing and make the font slightly larger.”

Iterating well

Be specific and concrete (“darker green header” beats “make it nicer”), change one thing per message so you can see what each edit did, and if a change goes wrong, just say “undo that” or describe what you actually wanted.

6. Publish and deploy

When you are happy, click **Publish** (or **Deploy**). The tool hosts the site and gives you a live, public URL — no servers, no setup. Open it on your phone to check it, then share the link. If you have a custom domain, both tools let you connect it from the same settings; you can also do that later.

4 • Make It Yours

Once it is live, small upgrades make it feel professional. Ask for these the same way — in plain language, one at a time.

Upgrade	What to ask for
Dark mode	“Add a light / dark mode toggle in the navigation bar.”
Projects	“Add a projects grid with image, title, description, and a link.”
Credibility	“Add a testimonials section and logos of places I have worked.”
Be found	“Add a clear page title, description, and social preview image for sharing.”
Custom domain	“Walk me through connecting my own domain name.”

Keep it alive

A portfolio is only useful if it is current. Every few months, paste in your updated résumé and ask the tool to refresh your experience and projects. Updating takes a minute, not an afternoon.

Your Build Checklist

- ✓ Résumé ready (your file, or exported from LinkedIn)
- ✓ Signed up to Lovable or Bolt.new and started a project
- ✓ Attached the résumé and sent a detailed prompt
- ✓ Iterated until the site looks right on desktop and mobile
- ✓ Published it and copied the live link
- ✓ Shared the URL with someone in the room

The skill you just practised is not web design — it is describing what you want clearly and refining it out loud. That same loop builds your next idea, whatever it is.
